                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. discorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of
                                                                                                                                                                                                                                                                                                                                                 New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory

The invention relates to formulations and methods which enhance the local and systemic uptake and delivery of oligonuclectides and nucleic acids via non-parenteral routes of administration. The formulation is used for treating inflammatory bowel disorders, e.g. ulcerative colitis, Crohn's disease or inflammatory bowel disease, in animals (e.g. human). It can also be used for treating undue cellular proliferation. The present sequence is an antisense oligonucleotide targetted to human intracellular adhesion molecule (ICAM-1) gene. This sequence is used to illustrate the

                                                                             New antibody that binds to an epitope of an inducible human phosphofructokinase-2 isozyme, useful for diagnosing or treating cancer,
                                                                                                                                                          The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (iPFK-2) isozyme. T antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA) immunological assays. The present sequence is AS-iPFK-2 antisense phosphorothicate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunomodulator; phosphofructokinase isozyme; iPFK; cancer; inflammation; cachexia; enzyme linked immunosorbant assay; ELISA; therapy; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel DNA vaccine for flatfish rhabdovirus (HIRRV) infected fishes, which provides immunity against HIRRV. The vaccination method uses a DNA construct comprising a transcriptional-control sequence control system of control sequence control sequence control provides immunity and immunogenic operably coupled to a nucleotide sequence encoding an immunogenic polypeptide of HIRRV. The DNA vaccine has virucide activity. The HIRRV DNA vaccine is useful for administering to a fish belonging to the flatfish family by gene gun. The HIRRV DNA vaccine is useful for immune response in fish infected by HIRRV DNA vaccine is useful for preventing HIRRV infection in flatfish. The HIRRV DNA vaccine is effective in enhancing immunity of fish infected by HIRRV. This polymucleotide sequence represents an oligo used in the analysis of the mRNA expression level from the muscles of flatfish, following an innoculation with the flatfish rhabdovirus vaccine of the invention.
                                                                                                                                                                          .

The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (iPFK-2) isozyme. The antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA vaccine for flatfish rhabdovirus infected fishes has DNA construct comprising a transcriptional control sequence coupled to a nucleotide sequence encoding an immunogenic protein of flatfish rhabdovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for typing a single nucleotide polymorphism (SNP) using a small amount of genomic DNA comprising simultaneous amplification of plural base sequences containing one or more SNP sites and differentiation of the bases within the SNP sites. The method of the invention may be useful for typing several hundred thousand SNP sites using only a comparatively small amount of genomic DNA. The current sequence is that of the SNP typing-related PCR primer of the

The invention relates to the early detection of pregnancy in a bovine animal by obtaining a sample from the bovine animal measuring the level of at least one bovine pregnancy associated glycoprotein (BoPAG) in the sample, and measuring the level of progesterone in the sample, where elevated levels of BoPAG and progesterone indicate that the bovine animal is pregnant. The method is useful in accurate early stage pregnancy detection in animals and in inocreasing the efficiency of commercial animal breeding programs. This sequence corresponds to a BoPAG-associated animal breeding programs. This sequence corresponds to a BoPAG-associated Early pregnancy detection in animals comprises obtaining a sample from the animal and measuring the levels of progesterone and bovine pregnancy associated glycoprotein in the sample. Homo sapiens 12-FEB-2004 PCR primer. 20 ADF09715; Query Match RESULT 1930 ADF09715/c Matches ઠે g ·; The present sequence is that of PCR primer mXbpl-354, which is specific to mouse X-box binding potential (mXBP1). It was used with primers mXbpl-804-AS APP18652 in an MXbpl-1150-R1 APP18652 in an RT-PCR analysis of RNA isolated from tunicamycin-tracted wild-type and IRE1-alpha-null murine embryonic fibroblasts. The primers were designed to amplify the region compassing the overlap between ORF1 and ORF2. The PCR demonstrated that Xbpl mRNA splicing is induced by endoplasmic retriculum (ER) stress and requires IRE1-alpha. Spliced XBP1 mRNA ADP18646 can activate the unfolded disorders. Diagnostic targets and therapeutic agents to enhance protein folding capabilities and limit the folding load on the BR are provided. Methods and compositions are provided for the treatment and diagnosis of protein conformational diseases or disorders, including alphal-antitrypsin deficiency, cystic fibrosis, and autoimmune diseases and disorders such as multiple sclerosis, musculus dystrophy, lupus and arthritis. Also provided are methods for modulating the UPR by modulating New nucleic acid molecule modulating unfolded protein response, useful for diagnosing or treating protein conformational disorders, such as cystic fibrosis, alpha-antitrypsin deficiency, multiple sclerosis, lupus Gaps . 0 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. The human apolipoprotein A-V (APOAV) gene, polynucleotides and polypeptides are useful for determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human apolipoprotein A-V (APOAV) polymucleotides and polypeptides, useful for identifying or screening of drugs that treat lipid-related or diabetic diseases, for lowering plasma triglycerides, or in gene therapy.
                                                                                                                                         The invention describes a method of preventing or treating tumour metastasis in an animal comprising administering to the animal an eligonucleocide 8-50 mucleocides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleocides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleocides have cytostatic and attiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human c-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; PCR; primer; human; apolipoprotien A-V; APOAV; triglyceride; lipid-related; diabetic disease; cardiovascular disease; plasma triglyceride; diabete; obesity; metabolic disease; gene therapy; single nucleotide polymorphism; apoA5.
                             Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using antisense oligonuclectide modulation of human raf gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

with a double-stranded RNA (dsRNA) molecule that corresponds to a target gene essential to growth of the pathogen and incubating the dsRNA molecule and the pathogen under conditions suitable for RNA interference. INDEPENDENT CLAIMS are also included for: a composition comprising dsRNA that corresponds to a target gene of the HIV genome; a method of dentifying a gene esquence that is a target for RNA interference aimed at inhibiting the growth of a pathogen; a method of treating a pathogenic condition in a host organism; and a method of making a transgenic organism capable of expressing a dsRNA that corresponds to a target gene of a pathogen. Preferred Method: In the method of inhibiting the growth of a pathogen is a retrovirus, which is HIV, or avian leukosis virus,

predisposition towards elevated triglyceride levels, for identifying or screening of drugs that treat lipid-related or diabetic diseases, or in genetic analysis of cardiovascular diseases. The APOAV polypeptide is useful for lowering plasma triglycerides or treating diabetes, obesity or other metabolic diseases. The APOAV gene and vector are useful in gene therapy. The single nucleotide polymorphisms are useful for determining the genetic status of individuals or for studying individual risk factors. The transgenic non-human animals are useful for further animal studies of human or mouse apoA5. The present sequence represents an APOAV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting the growth of a pathogen by contacting the pathogen with a double-stranded RNA (dsRNA) that corresponds to a target gene essential to growth of the pathogen and incubating the dsRNA and the pathogen for

cultering and Rous Sarcoma Virus. The pathogen causes a disease upon the infecting an organism, which is a vertebrate, mammal, bird or chicken. The wartebrate comprises mammals, birds, amphibians, repitles or fish. The wartebrate comprises dogs, cats, pigs, cows, sheep, goats, guinea pig. Tabbits, rats, mice, chimpazzes or humans. The bird is chicken or tars, mice chimpazzes or humans. The bird is chicken or turkey. The target gene is a cellular, viral or HIV gene, which is gap of or env. The contacting is by microinjection, transfection, viral or HIV gene, which is gap or env. The contacting is by microinjection, transfection, viral vector. It comprises a sequence that is a combination of sequence comprising ll2 or 211 amino acids. Identifying a gene cresponds comprises; selecting a candidate target gene sequence that is a target for RNA interference aimed at inhibiting the growth of the pathogen. Treating a pathogen curresponds to the target gene sequence; and determining whether the corresponds to the target gene sequence; and determining whether the corresponds to the target gene sequence under conditions for RNA interference; and contacting the organism comprises: identifying the pathogen curresponds to the target gene sequence under conditions for RNA interference; and contacting the organism capable of expressing a daRNA that corresponds to the target gene in a pathogen comprises; denote the corresponds to a target gene in a pathogen comprises; denote the corresponds to a target gene in a pathogen comprises in the pathogen; preparing a moraleic acid sequence baving a corresponds to a portion of the target gene; where the corresponds to a portion of the target gene; where the nucleic acid is able to form a double-stranded transcript. The corresponds to a trapent gene in the pathogen preparing a recipient organism; ontacting a recipient organism; and resting the offspring for expression of the double-stranded transcript. The animal is contacting the embryo to develop into a least on which the expression of

in human gene.

Claim 2; SEQ ID NO 1701; 704pp; Japanese.

```
cytostatic, neuroprotective, nootropic, antiatreriosclerotic, introduction and may be useful in identifying compounds that inhibit the induction of genes involved in viral infection, cancer, renal diseases or age-related diseases including Alzheimer's disease, atherosclerosis or arthritis, such genes being induced by cyclin-dependent kinase inhibitors. Furthermore, The construct may have gene therapy applications. The current sequence is that of the PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                            encoding a reporter gene operably linked to a promoter from a mammalian viral or cellular gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct of the invention demonstrates virucide,

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide corporations; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human or polymorphisms in human gene. The isolated human gene of the invention is useful for detecting the single nucleotide diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide copymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism cone of the invention.

Novel polynucleotide useful for detecting single nucleotide polymorphisms in human gene.

Claim 2; SEQ ID NO 1862; 704pp; Japanese.

The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligomoleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for detecting microorganisms using primers (ADF90918-ADF91145). The method is used for detecting microorganisms (Dacteria, fungi, protozoa, viruses) which cause diarrhoea symptoms, and pathogenic microbe of food poisoning. The method can be used to detect unspecified microbes, or specific pathogens, or for the simultaneous detection of many kinds of microorganism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rapid, sensitive detection of specific or unspecified microbes causing diarrhea and food poisoning, using primers which target universal and specific genes, and amplifying by PCR under heat cycle conditions
polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                              Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                               DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                           The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nuclectide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primer SEQ ID 26 used to amplify human PKD-1 exon 46A DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. The invention relates to a novel method of mutation analysis of a target nucleic acid which comprises incubating a sample having the target nucleic acid in a reaction mixture, in the presence of a least one first and second nucleic acid, where incubation produces amplified products, generating duplexes in the amplified products and detecting the presence or absence of a heteroduplex from the duplexes, where its presence indicates a potential mutation in the target nucleic acid and its absence and compositions of the invention may be useful for analysing mutation and diagnositions of the invention may be useful for analysing mutation and diagnositions affected with PKD (polycystic kidney disease). The current sequence is that of a PCR primer of the invention which was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
              Analyzing mutations of a target nucleic acid by detecting heteroduplexes from generated duplexes, useful for diagnosing patients affected with polycystic kidney disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Measuring GD2 synthase mRNA, useful for detecting or diagnosing cancer, e.g. neuroblastoma, small cell lung cancer, melanoma, by performing realtime quantitative RT-PCR on the sample using appropriate primers of GD2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Beta 1, 4-N-acetylgalactosaminyltransferase; GD2 synthase; GM2; RT-PCR; reverse transcriptase PCR; medullablastoma; astrocytoma; retinoblastoma; cancer; neuroblastoma; melanoma; lymphoma; carcinoma; sarcoma; tumour; primer; BAGE; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of measuring beta 1,4-N-acetylgalactosaminyltransferase (GD2/GM3 synthase) mRNA. The method involves obtaining an mRNA sample, performing real-time quantitative reverse transcriptase-polymerase chain reaction (RT-PCR) on the sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes a novel compound, 17-50 nucleobases in length which specifically hybridises with a nucleic acid encoding human bifunctional apoptosis regulator (BAR) and inhibits the expression of human BAR. The products of the invention have cytostatic and antiinflammatory activity and can be used to inhibit human BAR expression during antisense therapy, useful for inhibiting the expression of human
                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  using appropriate primers of GD2 synthase, and determining the amount of GD2 mRNA. The methods and kits are useful for detecting and/or diagnosing various forms of cancer such as neuroblastoma, melanoma, B cell lymphoma, osteosarcoma, soft tissue sarcoma, medullablastoma, high-grade astrocytoma, retinoblastoma, Wilm's tumour, Ewing's sarcoma, bladder carcinoma, lung cancer, breast cancer, pancreatic cancer, oseophageal cancer, astroma, head and neck tumours or melanoma. The present sequence is BAGE marker gene specific RT-PCR primer, used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or ansata airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensaive, independance of cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also
expression of BAR in an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of human BAR. In addition the antisense oligonucleotides are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumor formation. The oligonucleotides described in the invention have 2 -methoxyethyl (2'-MOE) oligonucleotides described in the invention have 2 -methoxyethyl (2'-MOE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; pytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensityity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or
                                                                                                                                   wings and a deoxy gap. This sequence represents a human BAR antisense oligonucleotide described in the disclosure of the invention

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 7845; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 4067; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinfilammatory steroid and ubiquinone. A composition of the invention has antiinfilammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also
for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition Note: The sequence data for this patent is not represented in the printed appecification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 3318; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also 

for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinome or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published\_pct\_sequences 222222222222**%**

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 1677; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 8092; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also 

```
The invention relates to preventing desulphurization of an oligonucleotide or its bioequivalent comprising one or more phosphorothioate linkages in a bi-phasic or multi-phasic formulation. The method involves including in the formulation an antioxidant which partitions into the aqueous phase of the formulation. The method is useful for increasing the stability of oligonucleotide comprising phosphorothioate linkages. The present sequence represents a 2'-deoxyoligonucleotide having a phosphorothioate backbone and is targeted to the 3' UTR (untranslated region) of ICAM-1 (intercellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing desulfurization of oligonuclectide comprising phosphorothioate linkages in bi-phasic/multi-phasic formulation, by adding to formulation an antioxidant that partitions into aqueous phase of the formulation.

The present invention describes a compound (1) 8-50 nucleobases in length cargeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises compound specifically hybridises with at least an 8-nucleobase portion of an splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an cative site on a nucleic acid molecule encoding HSL. (I) have anorectic, articiabetic and cytostatic activities, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity, cancer (e.g. pituleary, colorectal, breast, testicular, pulmonary or cancer (e.g. pituleary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose epithelial cancer). (I) is also useful in modulating blood glucose levels, particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase
                                                                                                                                                                                                                                       Hormone-sensitive lipase, antisense oligonucleotide; inhibitor; obesity; phosphorothicate; antidiabetic; anorectic; cytostatic; antisense therapy; abnormal metabolic condition; hyperlipidaemia; type 2 diabetes; cancer; hyperproliferative disorder; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted against nucleic acids encodi

The present invention describes a delayed release oral formulation (A),

giving enhanced gastrointestinal (GI) absorption of a drug (I). (A)

comprises a first set of particles containing (I) and a penetration

chancer (II) and a second set of particles containing (II) in a delayed

celease coating or matrix (III). (A) is used for enhancing the absorption

of (I) in mammals, especially humans. Typical disorders to be treated

include ulcerative colitis, rheumatoid arthritis, Crohn's disease,

confiles release (I) and (II) at a first location in the GI tract

(Generally the intestines), (II) is rapidly absorbed (during a first

celease pulse and is often present in insulfficient amount to promote

absorption of the entire dose of (I). This problem is solved by providing

celease (II) in delayed release form in the particles, so that absorption

of (I) is completed in a second pulse. The present sequence represents an

exemplary oligonucleotide from the present invention which inhibits ICAM-

The invention relates to a novel compound that is 8-50 nucleotides in length that is targeted to a nucleic acid molecule encoding apols), and specifically hybridises with and inhibits the expression of a nucleic acid molecule encoding ApoB; or which specifically hybridises with at least an 8-nucleotide portion of an aucleic acid molecule encoding ApoB; or which active site on a nucleic acid molecule encoding ApoB. A compound of the invention has antilipaemic, antiarteriosclerotic, antidiabetic, and cardiovascular activity. The compound may have a use in gene therapy. The antisense oligonucleotide is useful for treating an onectic, and disease or conditions associated with ApoB. e.g. a condition involving adisease or conditions associated with ApoB. e.g. a condition involving an abnormal lipid metabolism, a condition involving an abnormal lipid metabolism, a condition involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes incondition the abnormal metabolic condition or the antisense or cardiovascular disease). The new compound or the antisense oligonucleotide is also useful for modulating glucose levels oligonucleotide is also useful for modulating glucose levels. (particularly plasma or serum glucose levels) in a human or diabetic animal, or for modulating serum cholesterol levels, lipoprotein levels (specifically VLDL, HDL or LDL) or serum triglyceride levels.
                                                                                                                            ;

The invention relates to a method for determining oxidative stress markers in a group of individuals. The method comprises determining the risk factor for oxidative stress in the group, measuring the amount of at least 10 different oxidative stress markers in a sample obtained from each of the group of individuals, and comparing the amount of each of the oxidative stress markers with the amount of each of the oxidative stress markers are increased or decreased in a proup of healthy individuals to determine whether the oxidative stress markers are increased or decreased in the group of individuals carrying a risk factor for oxidative stress relative to healthy individuals. This sequence represents a PCR primer used to detect
                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region of a nucleic acid molecule encoding human Interleukin 12 p40 subunit. The compound specifically hybridises with one of the regions and inhibits the expression of human Interleukin 12 p40 subunit in calls or tissues and comprises contacting the calls or tissues and comprises contacting the calls or tissues in vitro with the compound, so that expression of the human Interleukin 12 p40 subunit is inhibited. The expression of the human Interleukin 12 p40 subunit is inhibited. The antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in an inhalts and humans.
                                                                        Human interleukin 12 p40 subunit antisense oligonucleotide ISIS #139157.
                                                                                                                                                                                                                                          /mod_base= OTHER

The present invention describes a method (M1) for determining a toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also determining the presence of a toxic response to the agent. Also comprising one or more polynucleotides selected from the genes corresponding to the partial sequences given in ABZBS42.

CC from the genes corresponding to the partial sequences given in ABZBS442.

CC from the genes corresponding to the partial sequences given in ABZBS442.

CC and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject of a known toxic pharmaceutical or industrial agent, comprising: (a) capposing cells to an agent; (b) obtaining the test gene expression profile or the expression profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxic responsely pharmaceuticals compounds and chemicals

The invention tradect to methods to intendity in regions or neoplastic growth in a human patient, especially for detecting or predicting metastasis. The methods involve determining whether a neoplastic growth carkerpressed, either by the use of an antibody specific for the protein, or by the use of PRO in hybridisation to detect nucleic acids encoding the marker proteins. A set of neoplastic growth markers are disclosed (SAGE (Serial analysis of gene expression) tags for these are given in ADA26759-ADA26796), with protein tyrosine phosphatese cy growth marker. The neoplastic growth markers are specifically expressed at a higher level in metastatic cancers, compared with advanced and early coverexpression of the neoplastic growth markers is taken as an indication of that the tissue has a propensity to metastasis. The invention also cancer, and for identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or identifying regions of neoplastic growth, for detecting or predicting metastasis, or identifying candidate drugs for treating advanced or identifying regions of neoplastic growth, for detecting or predicting compassatic cancers. The methods of the invention are useful for gastrointestinal, prostate, breast or colorectal cancers. Antibodies which bind to the neoplastic growth marker proteins are additionally consecut channely applicable to chamorheranents and for targeting remembers. The methods of colorectal cancers and indication in the present demander or colorectal cancers. Antibodies consecut channers represents a proper colorectal cancers. Antibodies consecut channers represents a proper colorectal cancers. Antibodies consecut channers represents a proper colorectal consecut and colorectal colorec chemotherapeutic drugs. The present sequence represents a reverse transcription-PCR (RT-PCR) primer used to study the upregulation of the human PRL-3 gene (located at chromosome 8q24.3) in an example of the The invention relates to methods for identifying regions of neoplastic

New isolated nucleic acid molecule encoding a daptomycin non-ribosomal peptide synthetase, useful for treatment of a gram-positive bacterial infection of skeletal muscle, skin, bloodstream, kidneys, heart, lung and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptomyces roseosporus daptomycin biosynthesis gene cluster primer P92.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the streptomyces roseosporus daptomycin biosynthesis gene cluster, the streptomyces roseosporus daptomycin biosynthesis gene cluster, especially a daptomycin non-ribosomal peptide synthetase (NRPS) or its subunit, where the (NA) molecule enrodes DptC, and is not pRHB159. The methods and compositions of the present invention are useful for treatment of a gram-positive bacterial infection of any organ or tissue in the body, including skeleral muscle, skin, bloodstream, kidneys, heart, lung and bone. This sequence represents a PCR primer used to isolate and amplify the daptomycin biosynthesis gene cluster (ADJ72363).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to new isolated nucleic acid (NA) molecules from

The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos. are also useful as tools, for hyperproliferation of determining the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligomucleotide 8-50 mucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma, and which is capable of inhibiting raf expression. Also included is a composition comprising the oligomucleotide and a pharmaceutically acceptable carrier. The antisense oligomucleotide is useful for inhibiting the expression of tuman raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a

gene katG, useful for distinguishing Mycobacterium tuberculosis infection from M. africanum, M. canetti, M. microti, M. bovis, or M. bovis BCG
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid encoding an Essential For Growth (BFG) polypeptide. The nucleic acid is useful for preparing a composition for treating fungal infection caused by Aspergillus fumigatus. This sequence corresponds to a PCR primer for one of the genes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antibacterial; vaccine; mmpL6; Mycobacterium; BCG; TbD1; ss; PCR; primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, vanaphylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal epithelium/peyer's patch M cell-associated DNA sequence of the invention.
                                  infestinal epithelium cell development; peyer's patch M cell development; inflammatory bowel disease; glutenenteropathy; infectious disease; autoimmune disease; haemolytic anaemas; rheumatoid arthritis; dermatitis; grave's disease; multiple sclerosis; allergy; asthma; diabetic mellitus; immune system disorder; hypersensitivity; anaphylaxis; blood group incompatibility; ss; human; PCR; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated or purified polypeptide encoded by genes associated with intestinal epithelium or M cell development, differentiation or function, useful for treating autoimmune diseases and infectious diseases.
Intestinal epithelium/peyer's patch M cell-associated PCR primer #175.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fungicide; gene therapy; Essential For Growth; EFG;

polypeptide encoded by a nucleic acid of the invention has antibacterial activity, and may have a use in a vaccine. The nucleic acid is a TbD1 nucleic acid having a fully defined sequence of 3953 bp given in the specification. The TbD1 daletion or mmpL6 551 polymorphism is useful as a genetic marker for the differentiation of Mycobacterium strain of M. tuberculosis complex. The genetic marker in association with at least one Rb9, Rb10, Rd11, Rb13, Rb14, Rv02, Rv03, Rv05, Rb7, Rb8, Rb9, Rb10, Rd11, Rb13, Rb14, Rv011, Rv02, Rv03, Rv04, Rv05, katg463, syrA655, oxyRv285, and pncA57, may be used for the differentiation of Mycobacterium strain of M. tuberculosis complex. The nucleic acids may also be used to distinguish an infection resulting from M. tuberculosis from an infection resulting from M. africanum, M. canetti, M. microti, M. bovis, M. bovis BcG. The present sequence is used in the exemplification bovis, M. bovis Bot of the invention.

New TbD1 nucleic acids having the mutation CTG to CGG at codon 463 of gene katG, useful for distinguishing Mycobacterium tuberculosis infection from M. africanum, M. canetti, M. microti, M. bovis, or M. bovis BCG

Disclosure; Page 19; 73pp; English.

The invention relates to a novel isolated or purified nucleic acid. A polypeptide encoded by a nucleic acid of the invention has antibacterial activity, and may have a use in a vaccine. The nucleic acid is a TbDI nucleic acid having a fully defined sequence of 3953 bp given in the specification. The TbDI deletion or mmpL6 551 polymorphism is useful as a genetic marker for the differentiation of Mycobacterium strain of M. Genetic marker selected from RDI, RD2, RD3, RD4, RD5, RD6, RD7, RD8, RD9, RD10, RD13, RD1, RD1, RD2, RVD3, RVD4, RVD5, RC11, RD7, RD3, RD14, RVD1, RVD4, RVD4, RVD4, RVD4, RD5, RC14663, Mycobacterium strain of M. tuberculosis complex. The nicleic acids may also be used to distinguish an infection resulting from M. tuberculosis

New antisense oligonuclectides for modulating p38 mitogen activated protein kinase (MAPK) expression, useful for diagnosing, preventing or treating diseases associated with p38 MAPK, e.g. inflammation or heart disease

Example 5; SEQ ID NO 75; 48pp; English

```
The invention relates to a novel modified human Factor VIII molecule. The modified human Factor VIII molecule being substantially non-immunogenic or less immunogenic than a non-modified human Factor VIII and having essentially the same biological specificity and activity when used in vivo. The modified human Factor VIII molecule comprises specifically altered amino acid residues compared with the non-modified parental molecule, where the altered amino acid residues cause a reduction or an elimination of one or more of the T-cell epitopes, which act in the parental non-modified molecule as MHC class II binding ligands and stimulate T-cells. The potential MHC class II binding activity peptide is useful for the manufacture of the modified Factor VIII molecule or a
The invention relates to an antisense oligonucleotide 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding a p38 mitogen activated protein kinase (MAPK). Where the antisense compound inhibits the expression of the p38 MAPK. The antisense oligonucleotide is useful for inhibiting the expression of p38 MAPK. The adisease or condition associated with p38 MAPK, e.g. an inflammatory or an autoimmune disease (e.g. rheumatoid arkhritis) or a heart disease. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a p38 MAPK antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New modified human Factor VIII molecule being substantially non-
immunogenic or less immunogenic than non-modified human Factor VIII,
useful in preparing a composition for treating e.g., Gaucher's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human Factor VIII; non-immunogenic; immunogenic; T-cell epitope; MHC class II; ligand; vaccine; immunogenicity; Gaucher's disease; ss;

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiathmatic, an algesic, hypotensive, immunosuppressive and cycostatic activity, is a composition comprises oligon and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The culmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconstriction, and/or bronchoconstriction and/or inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition, pulmonary vasconstriction and/or bronchoconstriction and/or bronchoconstriction and/or bronchoconstriction and/or bronchoconstriction and/or products allergic chindines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into products that free adenosine into products that free adenosine into product the tissue environment and thereby, the prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

Human; antisense; bronchoconstriction; allergy; hyposecretion; pain;

This invention describes a novel composition (a) a first active agent, comprising oligomuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine eensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligomucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung arway or lung expression or cancer and can be anti-sense to the corresponding mRNN. The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antihilammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of trarget polypeptide present in the lungs. The culticammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary viscomition, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary disease, pulmonary confinitammation, allergies and/or surfactant hypoproduction, respiratory hypertaction, allergies and/or surfactant hypoproduction, respiratory confinitammation, allergies, asthma, impeded respiration, respiratory hypertaction, pulmonary infections, pulmonary interess spidions rejection, pulmonary infections, present in the target RNA serves to prevent the broaders in the broaders in the pages RNA serves to prevent the broaders in the pages RNA serves to prevent the broaders in the pages RNA serves to prevent in the page the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it Claim 15; SEQ ID NO 3318; 763pp; English.

oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and composition for treating asthma, has antisense bronchodilating agent. Pharmaceutical

Claim 15; SEQ ID NO 7845; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung of expression also describes as kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, analgesic, hypotensive and cytostatic activity, is a confirmating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target manal or reduce the amount of target polypeptide present in the lungs. The milmons or malimatic received to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disasse or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system. t free adenosine into the system tissue environment and thereby, to e.g., lung, brain, heart, kidney, etc, prevent any unwanted effects due to it

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating accompanies of pronchoconstriction, respiratory tract inflammation, allergies and reduction according denosine (A) or (A) receptors, confactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating compression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, of the invention has antiallergic, antiinflammatory antiathmatic, beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or enconstruction and/or lungs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and ceducided adenosine (A) or (A) receptors, ceducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or hyposecretion, when administered to a mammal. The corpression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or mailgnant disease. The administered composition composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic;
                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and

to Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and oronchodilating agent.

Claim 15; SEQ ID NO 7659; 763pp; English.

comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The invention describes a novel composition (a) a first active agent, 

Cutypuraterorates are until now a year embouring airway or lung dysfunction of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition comprises oligo and is administered to reduce the production or vailability, or to increase the degradation of the target mRNA or to composition, allergies and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory continuammation, allergies, asthma, impeded respiration, respiratory continuammation rejection, pulmonary limections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the prevent the prevent. e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it oligonucleotides are derived from a gene encoding or regulating 88888888888888888888888888888888

This invention describes a novel composition (a) a first active agent, comprising oligonoclotides, effective for alleviating of comprising oligonoclotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, coligonoclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of the invention also describes a kit, that comprises: (b) adelivery of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated confusion such as pulmonary vascoonstriction, and or pulmonary alsergic rhintis; or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the inflammation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligon corresponding to the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the reduced belongs into products that free adenosine into the reduced belongs of the oligonucleotides into products that the terms of the content of the content of

This invention describes a novel composition (a) a first active agent, composition (a) alteriating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating cyptaction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of the invention has antiallergic, antiinflammatory, antiasthmatic, instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, or analgesic, phyotensive, immunosuppressive and cytostatic activity, is a heta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to correase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The culturation and/or bronchoconstriction and/or bronchoconstriction and/or bronchoconstriction and/or bronchoconstriction and/or languages, asthema, impeded respiratory vasoconstriction, and/or bronchoconstriction and/or languages, asthema, impeded respiratory confirmation relection, pulmonary infections, bornchilis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the cilgonucleotides into pracducts that free adenosine into the system of the inflammation, heart, heart ensemt in the target RNA serves to prevent the brashow to the oligonucleotides into pracduct etc. tissue environment and thereby.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it

Katz E, Pabalan J, Aguilar D;

This invention describes a nove composition, and a first active agent, compositing oligomoclectides, effective for alleviating oligomoclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine (son first and administered to a mammal. The surfactant depletion or hyposecretion, when administered to a mammal. The oligomoclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomoclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hyptomstre, immunosuppressive and cytostacic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition and administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoorenticition and/or lung association and/or surface and/or well associated. Inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiration, distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it This invention describes a novel composition (a) a first active agent,

```
The invention relates to a compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme. The antisense oligonucleotides and compounds are useful for inhibiting the expression of beta-site amyloid precursor protein (APP)-cleaving enzyme, modulating amyloid deposition in neurons, altering the expression of a splice variant of beta-site APP-cleaving enzyme, and for treating diseases or conditions associated with expression of beta-site APP-cleaving enzyme e.g. neurodegeneration or Alzheimer's disease. The antisense compounds are also useful as research reagents and kites, or in diagnostic, therapeutic and prophylaxis applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence

The invention relates to a compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme. The expression of beta-site amyloid precursor protein (APP)-cleaving the expression of beta-site amyloid precursor protein (APP)-cleaving enzyme, modulating amyloid deposition in neurons, altering the expression of a splice variant of beta-site APP-cleaving enzyme, and for treating diseases or conditions associated with expression of beta-site APP-cleaving enzyme e.g. neurodegeneration or Alzheimer's disease. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylaxis applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      An isolated region of the Y chromosome between SKY1 and sY83 which encompasses the Y-specific growth gene GCY, for identifying the presence or absence of a GCY gene associated with height.
                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme, useful for treating diseases associated with beta-site APP-cleaving enzyme, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Y chromosome; chromosome Y; SKY1; sY83; Y-specific growth gene; GCY; primer; sex-related height difference; height; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound targeted to a nucleic acid molecule encoding a beta-site amyloid precursor protein (APP)-cleaving enzyme. The antisense oligonuclectides and compounds are useful for inhibiting the expression of beta-site amyloid precursor protein (APP)-cleaving enzyme, modulating amyloid deposition in neurons, altering the expression of a splice variant of beta-site APP-cleaving enzyme, and for treating diseases or conditions associated with expression of beta-site APP-cleaving enzyme e.g. neurodegeneration or Alzheimer's disease. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylaxis applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present or represents a human APP-cleaving enzyme antisense oligonucleotide.

The present invention describes an isolated region of the Y chromosome between SKY1 and sY83 which encompasses the Y-specific growth gene GCY. Also described: (1) an isolated GCY protein, encoded by a region of the Y chromosome within the interval SKY1 and sY83; (2) a mucleic acid primer having a mucleic acid sequence selected from a mucleic acid primer as shown in Tables 2,5, 6,7A, 7B, 7C or 8 given in the specification; (3) studying GCY localisation or identifying a GCY gene associated with height comprising the use of a primer in (2) to selectively amplify or height comprising the use of a primer in (2) to selectively amplify or chect a region of a nucleic acid molecule; (4) an isolated protein contributes to the sex-related height difference in humans; and (5) use of a nucleic acid molecule comprising at least a portion of the isolated of a nucleic acid molecule comprising at least a portion of the isolated cregion of the Y chromosome between markers SKV8 and sY83, or a sequence complementary to it, to identify the presence or absence of a GCY gene associated with height. The isolated region of the Y chromosome between SKY1 and sY83, or a sequence complementary to it, is used to identify the presence or absence of a GCY gene associated with height by selective amplification or identifying a GCY gene associated with height by selective amplification. The present sequence is used in the exemplification of the present invention. Sequence 20 BP; 4 A; 6 C; 5 G; 5 T; 0 U; 0 Other;

The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding sterol regulatory element-binding protein-1 (SREBP-1, also known as sterol regulatory element-binding protein-1 (SREBP-1, also known as sterol regulatory element-binding transcription factor SREBP), and inhibits the expression of SREBP-1, i.e. is an antisense oligonocleotide. Also included are a compound 8-80 nucleobase portion of an active site on a nucleic acid molecule encoding sterol regulatory element-binding protein-1, a composition comprising the compound and a carrier or diluent, inhibiting the expression of sterol regulatory element-binding protein-1 in cells or tissues (by contacting the cells or tissues with the compound or sterol regulatory element-binding protein-1 in cells and treating an animal having a disease or condition compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element-binding protein-1 is inhibited. The animal a therapeutic or prophylactic amount of the compound so that expression of sterol regulatory element binding protein-1 is inhibited and reacting sugar moiety (preferably 2.0-methoxyethyl sugar condition sugar one modified sugar moiety) or at least one modified sugar moiety (preferably 2.0-methoxyethyl sugar condition associated with sterol regulatory element binding a disease or condition associated with sterol regulatory element binding protein-1 such as a merabolic disease or condition associated with sterol regulatory element New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding sterol regulatory element-binding protein-1, useful for treating diabetes, atherosclerosis or hyperlipidemia. binding protein-1, such as a metabolic disorder e.g. diabetes, or a cardiovascular disorder, e.g. atherosclerosis or hyperlipidaemia. They are also useful in research and diagnostics for modulating the expression of sterol regulatory element-binding protein-1. The present sequence is an antisense oligonucleotide targeting human SREBP-1. 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B. The compound of the invention demonstrates antiarterisoslarcitic.

The compound of the invention demonstrates antiarterisoslarcitic.

pardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or applications. The current sequence, the compound has gene therapy applications. The current sequence is that of the 2'-O-methoxyethyl (2'-MOB) appmer antisense oligo of the invention which has 2'-MoE wings', a phosphorothicate backbone throughout and in which all cytidine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to a novel antisense compound targeted to a nucleic
                                                                                                                                                                                                                                                                                                                                            New antisense compound, useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 15; SEQ ID NO 52; 405pp; English.

The present invention relates to antisense compounds targeted to a nucleic acid encoding extracellular-signal-regulated kinase-6. The antisense compound comprises an antisense oligomuclectide that specifically hybridises with the nucleic acid and inhibits the expression of extracellular-signal-regulated kinase-6. The antisense oligomuclectide is a chimeric oligomuclectide. The antisense oligomuclectide comprises at least one modified sugar moiety, preferably a class one modified internuclectide linkage, preferably a phosphorothicate comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonuclectide further comprises at least one modified augar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-0-methoxyethyl (3'-MOE) sugar moiety. The antisense oligonuclectides are useful for the treatment of diseases such as hyperproliferative disorders, preferably cancer, inflammatory disorders, and neurodegenerative disorders, preferably preferably allammatory disorders and neurodegenerative disorders, concert, inflammation or tumour formation. The present sequence represents an antisense oligonuclectide used in the examples of the present invention. New antisense compound targeted to a nucleic acid molecule encoding extracellular-signal-regulated kinase-6, useful for modulating expression of extracellular-signal-regulated kinase-6 or treating cancer. /note = "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOB) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines. Gaps .. 0 0.8%; Score 13.6; DB 1; Length 20; 10.0%; Pred. The invention relates to novel inducible phosphofructokinase isoenzyme (iPFK-2) polypeptides (preferentially transcribed and translated in tumour cells) and nucleic acid molecules encoding such polypeptides. The invention also provides a cancer malignancy diagnostic assay. The assay involves obtaining a sample of body or tumour fluid or tissue, performing a sequences identity assay to detect the presence of iPFK-2 specific sequences. The invention is useful for treating cancer and inflammatory disease. The present sequence is human antisense oligonucleotide used in
                                                                                                                                                                                                                                                                                                                                                                      Novel inducible phosphofructokinase isoenzyme polypeptide expressed by cDNA, useful for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; inducible phosphofructokinase; iPFK-2; cancer; inflammatory disease; therapy; antisense; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to antisense compounds targeted to a nucleic acid encoding extracellular-signal-regulated kinase-6. The nucleic acid encoding extracellular-signal-regulated kinase-6. The antisense compound comprises an antisense oligonuclecide that specifically hybridises with the nucleic acid and inhibits the expression of extracellular-signal-regulated kinase-6. The antisense oligonuclectide comprises at least one modified sugar moiety preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a comprises at least one modified sugar moiety, preferably a comprises at least one modified sugar moiety preferably of a 2'-O-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonuclectide methylcytosine. The antisense oligonuclectides are useful for the methylcytosine. The antisense oligonuclectides are useful for the creatment of diseases such as hyperproliferative disorders, preferably cancer, inflammatory disorders, and neurodegenerative disorders, preferably a prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human extracellular-signal-legilated kinase-6 DNA target sequence for an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·.
                                                                                                                                                                                                                                                                                                                                                           extracellular-signal-regulated kinase-6, useful for modulating expression of extracellular-signal-regulated kinase-6 or treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

(IPFK.2) polypeptides (preferentially transcribed and translated in tumour cells) and nucleic acid molecules encoding such polypeptides. The invention also provides a cancer malignancy diagnostic assay. The assay involves obtaining a sample of body or tumour fluid or tissue, performing a sequence identity assay to detect the presence of iPFK-2 specific sequences. The invention is useful for treating cancer and inflammatory disease. The present sequence is human antisense oligonucleotide used in
                                                                                                                                                                                                                                                                                                                                      Novel inducible phosphofructokinase isoenzyme polypeptide expressed by cDNA, useful for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention relates to novel inducible phosphofructokinase isoenzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 4 A; 5 C; 8 G; 3 T; 0 U; 0 Other;

Determining whether an individual is predisposed to type 2 diabetes and/or insulin resistance, useful for treating and/or preventing such disease, comprises typing the LPIN2 gene region or LPIN2 protein of the individual

Example 4; Page 41; 152pp; English

This invention relates to a novel method for determining whether an individual is predisposed to type 2 diabetes and/ or insulin resistance. Specifically, it comprises typing the human lipin 2 (LPINZ) gene in order to detect at least one of the four recognised single mucleotide polymorphisms (SNPs) known to be associated with type 2 diabetes and linkage disequilibrium polymorphisms that indicate a susceptibility or genetic predisposition to these conditions. The method comprises contacting a test agent with an LPINZ mutated polymocleotide or modulating the activity or expression of the molecule. Accordingly, these compositions exhibit antidiabetic activity and can be used to treat type compositions exhibit antidiabetic activity and can be used to treat type 2 diabetes and/or insulin resistance using gene therapy. This oligonucleotide sequence is a biotin labelled PCR primer used to amplify a human LPIN2 DNA fragment containing a SNP of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a polynuclectide (I) encoding human erythroid membrane-associated protein (BRMAP), its fragment or variant, carrying at least one mutation as compared to the nuclectide sequence (SEQ ID NO: 1).

The mutation in (I) is a missense mutation causing an amino acid substitution in the extracellular portion of the ERMAP protein, causing an amino acid substitution in position 26, 57 and/or of of the amino acid sequence of ERMAP. The mutation may also be a delation causing a shift in the reading frame of the ERMAP gene, where the mutation occurs in nuclectide position 54, 178, 169, 178, 307 and/or correct in mutation in nuclectide position 54 from C to T, or a missense mutation in position 76 from C to T, a G to A in position 169, and/or a C to G in position 178. The mutation may be a deletion of nuclectide position 308 of the ERMAP gene (SEQ ID NO: 1). The polynuclectide, oligonuclectide, antibody, aptamer or phage is useful for the detection of a Scianna antigen and/or for the cdetermination of the Scianna antigen and/or for the preferably red blood cells, are useful for a serologic test. The polynuclectide may also be used in the characterisation of monoclonal and
                                                                                                                                                        ;
0
polypeptide and determining whether it is capable of binding and/ or modulating the activity or expression of the molecule. Accordingly, these compositions exhibit antidabetic activity and can be used to treat type 2 diabetes and/ or insulin resistance using gene therapy. This oligonucleotide sequence is a PCR primer used to amplify human LPIN2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding a human erythroid membrane-associated protein (ERMAP) having at least one mutation compared to a wild type ERMAP, useful for detecting Scianna antigen or determining Scianna

This invention relates to novel compositions and methods for modulating the expression of PTPIB (also known as protein phosphatase 1B and PTPNI). Specifically, it refers to antisense compounds that can target and hybridise with a nucleic acid molecule encoding PTPIB, as well as splice variants thereof and inhibit expression accordingly. PTPIB is a tyrosine phosphatase that plays an essential regulatory role in signalling mediated by the insulin receptor and as such is useful for treating diseases such as type 2 diabetes and obesity. Furthermore, PTPIB can suppress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions including cancer. Accordingly, these compounds can be described as having cytostatic, antidiabetic and anorectic activities. This oligonucleotide sequence is an antisense DNA oligo that targets human PTPIB DNA, and which has a phosphorothicate backbone and 2'-O-methoxyethyl wings, used in an exemplification of the invention.

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding dual specific phosphatase 4, useful for treating cancer, developmental disorder or a condition arising from aberrant apoptosis 

Example 15; SEQ ID NO 60; 61pp; English

The present invention relates to antisense compounds targeted to a nucleic acid encoding dual specific phosphatase 4. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of dual specific phosphatase 4. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises such as one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, developmental disorders, and diseases associated with aberrant apoptosis. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating the expression of g protein-coupled receptor (GPCR) 39. The antisense oligonuclectide is useful in modulating the function of nucleic acid molecules encoding GPCR 39. It is also used as research tools and diagnostics and is used as tools in differential and/or the entire complement of genes expressed within cells and issues. The antisense compound is used for treating diseases or conditions associated with GPCR 39, preferably hyperproliferative disorder, e.g. cancer or a neurological disorder. It is also used as prophylaxis, e.g. to prevent of delay infection, inflammation or tumour formation. The antisense oligonucleotide is useful in antisense gene therapy. The present sequence
The antisense oligonucleotide is useful in modulating the function of nucleic acid molecules encoding GPCR 39. It is also used as research tools and diagnostics and is used as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The antisense compound is used for treating diseases or conditions associated with GPCR 39, preferably hyperproliferative disorder, e.g. cancer or heurological disorder. It is also used as prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The antisense oligonucleotide is useful in antisense gene therapy. The present sequence is an antisense oligonucleotide targetted towards human GPCR 39. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G protein-coupled receptor; GPCR; research tool;

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein Kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                  New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding PCTAIRE protein kinase 2, useful for preparing a composition for treating neurological disorders.

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2. that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding pCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human treating e.g., neurological disorders.

The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                           /mod_base= OTHER

sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                    /mod_base= OTHER /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "OTHER= Phosphorothioate backbone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER /note= "OTHER= Phosphorothioate backbone. The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "OTHER= Phosphorothioate backbone.                                                                                                                                                                                                                                                                                                                                  The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                 New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding PCTAIRE protein kinase 2, useful for preparing a composition for treating neurological disorders.

                                                                                                                                                                                                                                                                                                   The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

                                                                                                                                                            The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER=

The invention relates to antisense compounds, compositions and methods for modulating the expression of extracellular-signal-regulated kinase-6 (ERK-6). The compound is useful in treating an animal having a disease or condition associated with ERK-6, e.g. a hyperproliferative disorder (especially cancer), an inflammatory disorder or a neurodegenerative disorder inhibiting angiogenesis, for preventing tubular formation of blood vessels, and for preventing degradation of extracellular matrix for new blood wessel formation. The present sequence is an antisense oligonucleotide targetted towards human ERK-6 DNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound targeted to a mucleic acid molecule encoding extracellular-signal-regulated kinase-6, useful for treating angiogenic, hyperproliferative (cancer), inflammatory or neurodegenerative disorders (Alzheimer's disease).
                                                                        New compound targeted to a nucleic acid molecule encoding extracellular-signal-regulated kinase-6, useful for treating angiogenic, hyperproliferative (cancer), inflammatory or neurodegenerative disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Extracellular-signal-regulated kinase-6; ERK-6; hyperproliferative disorder; cancer; inflammatory disorder; neurodegenerative disorder; Alzheimer's disease; angiogenesis; tubular formation; matrix degradation; human; therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                               The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Phosphorothioate backbone in which all cytidines are 5-methylcytidines"
                                        New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding PCTAIRE protein kinase 2, useful for preparing a composition for treating neurological disorders.

The present invention relates to a method for identifying a compound that induces senescence in a mammalian cell. The method comprises assaying the expression of callular genes in the cell. In the presence and absence of the compound. The method is useful for identifying and modulating expression of tumour senescence genes. These may be used in treating diseases or conditions related to abnormal cell proliferation or neoplastic cell growth, in assessing the efficacy of the treatment of the disease or condition, or in identifying compounds that induce senescence in mammalian cells or that inhibit senescence-associated induction of cellular gene expression. PCR primers ADH80277-ADH80400 were used to amplify genes that are up- or downregulated in doxorubicin-induced accelerated senescence to identify senescence-inducing compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying compounds that induce senescence in mammalian cells, useful for treating e.g. cancer, comprises assaying the expression of cellular genes in the cell in the presence and absence of the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 4; SEQ ID NO 48; 102pp; English.

Claim 2; SEQ ID NO 5038; 2627pp; Japanese.

·; The invention relates to antisense compounds, compositions and methods for modulating the expression of extracellular-signal-regulated kinase-6 (ERK-6). The compound is useful in treating an animal having a disease or condition associated with ERK-6, e.g. a hyperproliferative disorder (especially cancer), an inflammatory disorder or a neurodegenerative disorder (especially Alzheimer's disease). It is also useful for inhibiting angiosenesis, for preventing tubular formation of blood vessels, and for preventing degradation of extracellular matrix for new blood vessel formation. The present sequence is human ERK-6 target DNA fragment. This sequence is used to illustrate the method of the Gaps Cytostatic; human; senescence; tumour; PCR; primer; ss; MAC2-BP. .; Length 20; 4; Indels Sequence 20 BP; 6 A; 4 C; 7 G; 3 T; 0 U; 0 Other; Score 13.6; DB 1; Pred. The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(iss), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g., asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; endocrine; hepatoma-derived growth factor inhibitor; hepatoma-derived growth factor; metabolic disorder; hyperproliferative; human; ss; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatoma-derived growth factor antisense oligo segid 134.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ·.
                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding hepatoma-derived growth factor. And inhibits the expression of hepatoma-derived growth factor. The compound, composition and methods are dusful for treating a disease or condition associated with hepatoma-derived growth factor, such as a metabolic disorder, or a hyperproliferative disorder. e.g. cancer, which is selected from hepatoma, leiomyoma, esophageal cancer or ovarian cancer. They are also useful in research and diagnostics for modulating the expression of hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antidiabetic; anorectic; cardiant; antiarteriosclerotic; resistin inhibitor; resistin; metabolic disease; diabetes; obesity; atherosclerosis; antisense technology; human; antisense oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The compound, composition and methods are useful for treating a disease or condition associated with resistin, such as a metabolic disease, e.g. diabetes or observe, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence represents a human resistin antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding resistin, useful for treating a metabolic disorder,
e.g. diabetes or obesity, or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antidiabetic; anorectic; cardiant; antiarteriosclerotic; resistin inhibitor; resistin; metabolic disease; diabetes; obesity; atherosclerosis; antisense technology; human; antisense oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The compound, composition and methods are useful for treating a disease or condition associated with resistin, such as a metabolic disease, e.g. diabetes or obsestly, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence represents a human resistin antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding resistin, useful for treating a metabolic disorder,
e.g. diabetes or obesity, or atherosclerosis.

The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding endothelial differentiation gene 1 (EDC1, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and inflammation), and inhibits the expression of EDG1, i.e. is an antisense compound and a carrier or diluent and a method for screening an antisense compound (by contacting a preferred target region of a nucleic acid molecule encoding EDG1 with one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding EDG1 with one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding EDG1).

The compound, composition and methods are useful for treating a disease or condition associated with EDG1, such as a hyperproliferative disorder, apoptosis. They are also useful in research and diagnostics for modulating the expression of EDG1. Experimental protocols are described to the present sequence is an AS oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                                                                                                                                                     Homo
The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding endothelial differentiation gene 1 (EDG1, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and inflammation), and inhibits the expression of EDG1, i.e. is an antisense (AS) oligonucleotide. Also included are accomposition comprising the compound (by contacting a preferred target region of a nucleic acid molecule encoding EDG1 with one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding EDG1. The compounds that inhibit the expression of a nucleic acid encoding EDG1. The compound composition and methods are useful for treating a disease or condition associated with EDG1, such as a hyperproliferative disorder, apoptosis. They are also useful in research and diagnostics for modulating the expression of EDG1. Experimental protocols are described because the compound of the expression of EDG1. Experimental protocols are described because the compound the expression of EDG1. Experimental protocols are described because the control of the compound that the expression of EDG1. Experimental protocols are described because the compound to the expression of EDG1. Experimental protocols are described because the expression of the compound the expression of the present sequence is a target region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotide targeted to nucleic acid encoding endothelial differentiation sphingolipid G-protein-coupled receptor 1, for treating cancer, developmental disorder or a condition arising from

The expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonuclectides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-Omethoxyethy1 (2' MOB) and at least one modified sugar moiety, a 2'-Omethoxyethy1 (2' MOB) and at least one modified sugar moiety, a competition. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, dyslipidemia, atherosoclerosis, low HDL (high density lipoprotein), high child consisty lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromacase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antisinfammatory and virucidal activities. This oligonucleotide sequence is an antiscense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel antisense compounds useful for modulating
New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis,
                                                                                                                                                                                                                                                                                         Example 15; SEQ ID NO 384; 909pp; English.

Specifically, it refers to compositions 8-30 mucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan

nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligomucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, as 2'-0-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-methyloytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LBHI, such as breast cancer, diagnosing a disease associated with LBHI, such as breast cancer, displaying theoretics, low HDL (high density lipoprotein), high LDL (low density lipoprotein), hypercholesterolaemia, gall stones, triglycerideemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antilarteriosclerotic, anorectic, hepatotropic, litholytic, antilnflammatory and virucidal activities. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              phosphorothicate; 2' MOE, breast cancer; dyalipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; all stone; triglyceridaemia; obesity; hepatitis; hepatocellular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiliflammatory; virucidal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (IRH1) and splice variants conversation. Second thereof. Specifically, it refers to compositions 8-30 nucleobases in clength that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that functions as a tissue specific conclear receptor protein that function describes antisense conjudy at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar moiety, and specific mothorisate linkage, at least one modified sugar moiety, and specific associated with LRH1, such as breast cancer, diagnosing a disease associated with LRH1, such as the secondation associated with aromatase activity. Accordingly, these compositions exhibit contingements, antilarreniosclerotic, ancertic, hepatotic sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
